

While energy management is more strategic than ever, Arc France obtains ISO 50001 «Energy Management» certification

Innovative glass
for a better world

Concrete action of the month:

The world's leading tableware manufacturer has considerable energy requirements for glass production. At the historic production site in Arques, northern France, the furnaces operate 24/7 and are heated to 1,560°C.

Energy management is therefore a huge challenge, both economically and environmentally. In October 2022, Arc France obtained ISO 50001 certification.

This certification ensures the implementation of a sustainable monitoring of energy performance:

- Continuous improvement of energy efficiency
- Implementation of an energy performance culture
- Reduction of the environmental footprint

Concrete examples of actions implemented:

- Involvement of employees through training and awareness raising
- Collection, communication and implementation of energy good practices
- Improvement of "real time" control, recovery and automatic display of energy data at the workstation
- Replacement of existing equipment with new, more energy-efficient equipment (lighting, compressors, etc.)
- Compressed air leakage search and repair campaigns

Responsible is the Arc's programme to reduce our environmental impact. It is built around 7 projects planned until 2030. Each month we highlight a concrete action with tangible results on the environment.
